Product:	Elevator Control Cabinet
Model No.:	SJT-WVF5
Brand Name:	/
Serial No.:	K1801001
Rating:	Power: 75kW Input: AC3Ph 380, 50/60Hz, 190A Output: 0-380V, 0-60Hz, 165A
Accessories:	/

1. For a more detailed features description about the EUT, please refer to User's Manual.

Perform ElectroMagnetic Interference (EMI) and ElectroMagnetic Susceptibility (EMS) tests for CE Marking.

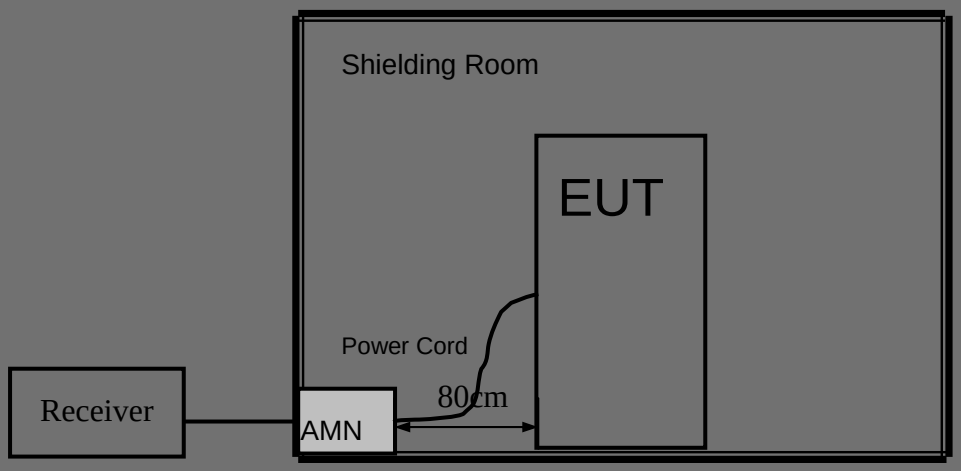

Emission: 2018.01.13 ~ 2018.01.14
Immunity: 2018.01.15 ~ 2018.01.22

The EUT has been tested according to the following specifications:

EN 12015:2014	Mains terminal disturbance voltage	PASS
	Radiated disturbance	PASS
	Impulse noise	PASS
	Voltage fluctuations	
	Mains supply current harmonics	

Test Receiver	ROHDE&SCHWARZ	ESCI	Jun.04, 2018	A130901474
LISN	SCHWARZBECK	NNLK8130	Jun. 04, 2018	A131001541

The EUT was powered by 380V AC Mains and connected to a motor with no load. The EUT operated in SVC control and max carrier frequency mode.

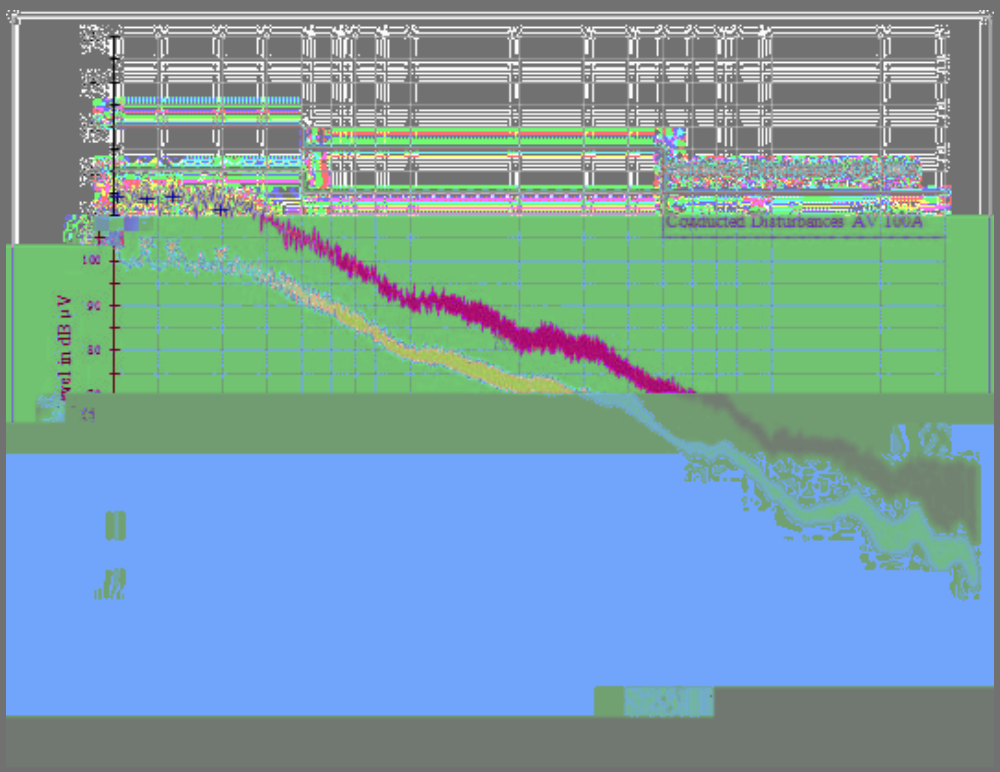

For the actual test configuration, please refer to the related item - Photographs of the Test Configuration.

		P		P	
1	0.1540	114.2	104.1	130	120

1. QP and AV are abbreviations of the quasi-peak and average individually.
2. If the emission levels measured with QP detector are lower than AV limits, there is unnecessary to measure with AV detector.
3. The emission levels recorded above is the larger ones of each phase.

Measurement Plots

The EUT was powered by 380V AC Mains and connected to a motor with no load. The EUT operated in SVC control and max carrier frequency mode.

	All Circuits	Safety circuits
	IEC 61000-4-2	
	330Ω / 150 pF	
	Air Discharge: 8 kV Contact Discharge: 4 kV	Air Discharge: 15 kV Contact Discharge: 6 kV
	Positive / Negative	
	Minimum 20 times at each test point	
	Single discharge	
	1-second minimum	
	B	D

The discharges shall be applied in two ways:

a. Contact discharges to the conductive surfaces and coupling planes:

The EUT shall be exposed to at least 200 discharges, 100 each at negative and positive polarity, at a minimum of four test points. One of the test points shall be subjected to at least 50 indirect discharges to the center of the front edge of the horizontal coupling plane. The remaining three contact test points shall each receive at least 50 direct contact discharges. If no direct contact test points are available, at least 200 indirect discharges shall be applied in the indirect mode. Test shall be perf7rj4.3(har)10902 T19.39.64S(con..50 d)-27m

restricted to those area normally handled selected test point for each such area.

The basic test procedure was in accordance with IEC 61000-4-2:

a. Electrostatic discharges were applied only to those points and surfaces of the EUT that are accessible to users during normal operation.

b. The test was performed with at least ten single discharges on the pre-selected points in the most sensitive polarity.

c. The time interval between two successive single discharges was at least 1 second.

d. The ESD generator was held perpendicularly to the surface to which the discharge was applied and the return cable was at least 0.2 meters from the EUT.

e. Contact discharges were applied to the non-insulating coating, with the pointed tip of the generator penetrating the coating and contacting the conducting substrate.

f. Air discharges were applied with the round discharge tip of the discharge electrode approaching the EUT as fast as possible (without causing mechanical damage) to touch the EUT. After each discharge, the ESD generator was removed from the EUT and re-triggered for a new single discharge. The test was repeated until all discharges were completed.

g. At least ten single discharges (in the most sensitive polarity) were applied to the Horizontal Coupling Plane at points on each side of the EUT. The ESD generator was positioned vertically at a distance of 0.1 meters from the EUT with the discharge electrode touching the HCP.

h. At least ten single discharges (in the most sensitive polarity) were applied to the center of one vertical edge of the Vertical Coupling Plane in sufficiently different positions that the four faces of the EUT were completely illuminated. The VCP (dimensions 0.5m × 0.5m) was placed vertically to and 0.1 meters from the EUT.

For the actual test configuration, please refer to Appendix II: Photographs of the Test Configuration.

	1.5m	
	3 seconds	
	A	D

The test procedure was in accordance with IEC 61000-4-3.

a. The testing was performed in a fully anechoic chamber. The transmit antenna was located at a distance of 3 meters from the EUT.

b. The frequency range is swept from 80 MHz to 2655 MHz with the signal 80% amplitude modulated with a 1 kHz sine wave. The rate of sweep did not exceed 1.5×10^{-3} decade/s. Where the frequency range is swept incrementally, the step size was 1% of fundamental.

c. The dwell time at each frequency shall be not less than the time necessary for the EUT to be able to respond.

d. The field strength level was 10V/m and 30V/m.

e. The test was performed with the EUT exposed to both vertically and horizontally polarized fields on each of the four sides.

For the actual test configuration, please refer to Appendix II: Photographs of the Test Configuration.

For the actual test configuration, please refer to Appendix II: Photographs of the Test Configuration.

	B	D

a. The EUT and the auxiliary equipment were placed on a table of 0.8m heights above a metal ground reference plane. The size of ground plane is greater than 1m×1m and project beyond the EUT by at least 0.1m on all sides. The ground plane is connected to the protective earth. The length of power cord between the coupling device and the EUT was less than 2 meters (provided by the manufacturer).

b. The EUT was connected to the power mains through a coupling device that directly couples the surge interference signal. The surge noise was applied synchronized to the voltage phase at the zero crossing and the peak value of the AC voltage wave (positive and negative).

c. The surges were applied line to line and line(s) to earth. When testing line to earth the test voltage was applied successively between each of the lines and earth. Steps up to the test level

specified increased the test voltage. All lower levels including the selected test level were tested. The polarity of each surge level included positive and negative test pulses.

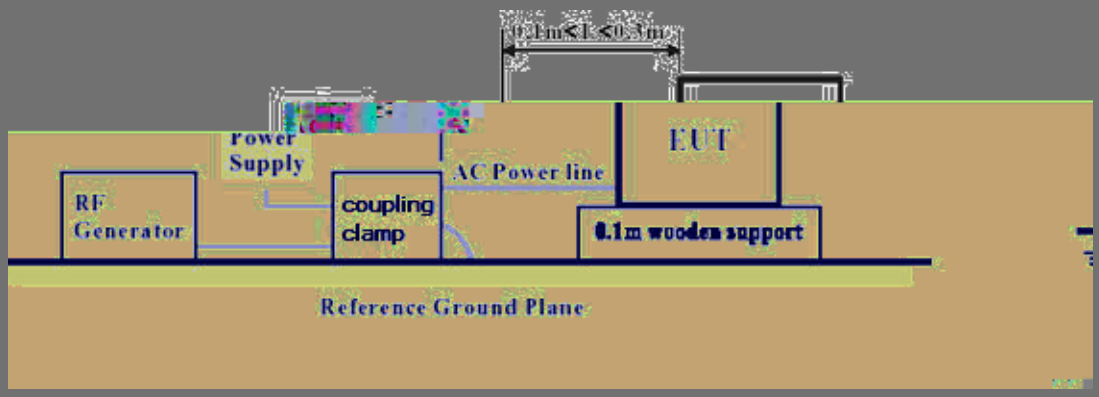

For the actual test configuration, please refer to Appendix II: Photographs of the Test Configuration.

a.c. power, Line to earth	+/-	2	Note (1)	A
a.c. power, Line to line	+/-	1	Note (1)	A

(1). The EUT continued to operate as intended. No degradation of performance was observed.

	All Circuits	Safety circuits
	IEC 61000-4-6

a. The EUT shall be tested within its intended operating and climatic conditions.
b. The test shall be performed with the test generator connected to each of the coupling and decoupling devices in turn, while the other non-excited RF input ports of the coupling devices are terminated by a 50-ohm load resistor.
c. The frequency range is swept from 150 kHz to 80 MHz, using the signal level established during the setting process and with a disturbance signal of 80% amplitude. The signal is modulated with a 1 kHz sine wave, pausing to adjust the RF signal level or the switch coupling devices as necessary. The sweep rate shall not exceed 1.5×10^{-3} decades/s. The step size shall not exceed 1% of the start and thereafter 1% of the preceding frequency value where the frequency is swept incrementally.
d. The dwell time at each frequency shall not be less than the time necessary for the EUT to be exercised, and able to respond. Sensitive frequencies such as clock frequencies and harmonics or frequencies of dominant interest, shall be analyzed separately.
e. Attempts should be made to fully exercise the EUT during test, and to fully interrogate all exercise modes selected for susceptibility.

a. The power cord was used as supplied by the manufacturer. The EUT was connected to the line output of the Voltage Dips and Interruption Generator.

b. The EUT was tested for (I) 60% voltage dip of supplied voltage with duration of 200ms, (II)30% voltage dip of supplied voltage and duration 500ms, (R)100% voltage dip of supplied voltage and duration 20ms.

c. 100% voltage interruption of supplied voltage with duration of 5000ms was followed, which was a sequence of three voltage interruptions with intervals of 10 seconds.

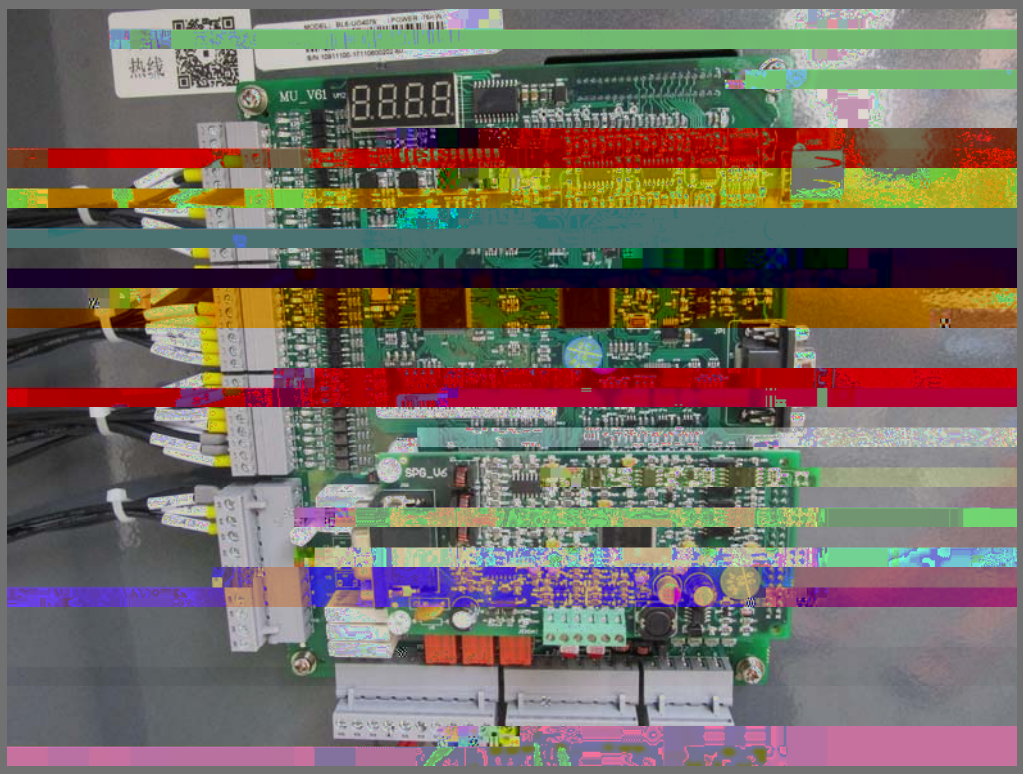

d. Voltage reductions occur at 0 degree crossover point of the voltage waveform. The performance of the EUT was checked after the voltage dip or interruption.

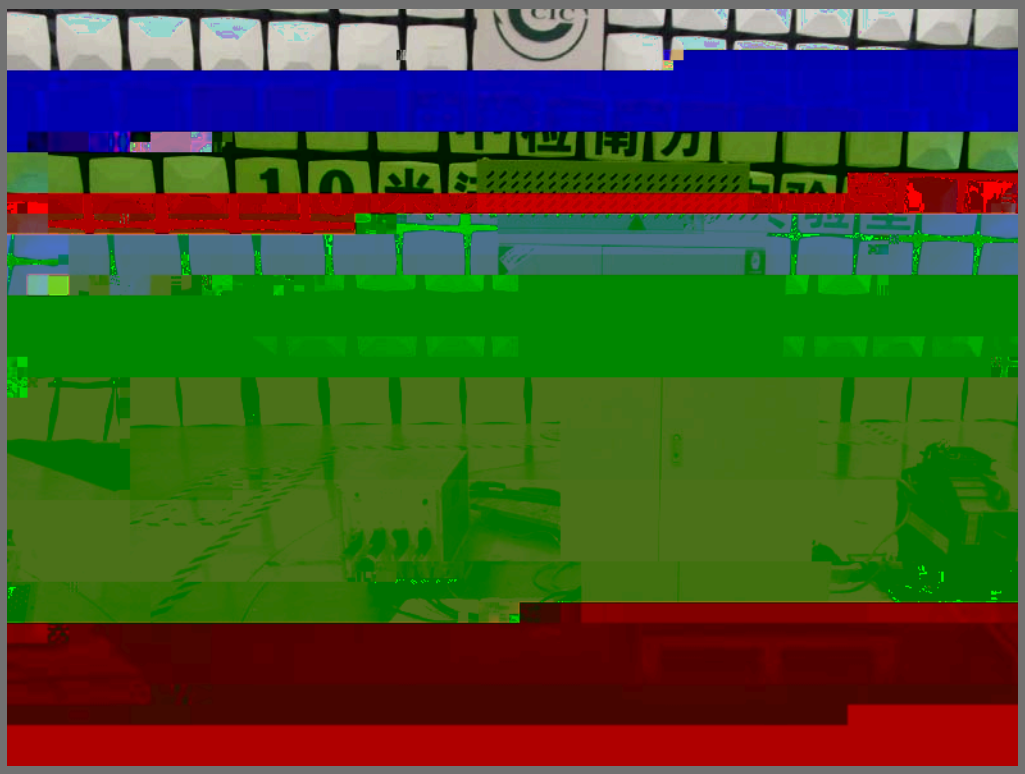

For the actual test configuration, please refer to Appendix II: Photographs of the Test Configuration.
